

Closing Manager — the real AI is on, tested, and working

Roadmap task A2 · completed July 31, 2026 · summary prepared by Claude for Brendon Achildi

The closing-manager app (an AI-assisted closing and task manager for a PA/NJ title agency) previously read email with a simple word-matching engine — a placeholder that only spots exact, literal phrases. This week it was switched over to a real language model (Anthropic's **claude-sonnet-5**), and the switch was proven with a live, repeatable test. Every AI suggestion still goes to the human review queue; nothing is approved automatically.

The test

One deliberately messy — but realistic — email is the acceptance test, because the old engine is known to fail on it four ways:

Subject: RE: RE: FW: Kowalski / 88 Rosewood

"Hi - circling back on this one. We still dont have the CPL and underwriting is asking. Also can you confirm the payoff was ordered? Borrower is asking about Thursday at 10, does that still work for the Cherry Hill office? Loan #LN-44821. Thanks"

The four things the old word-matcher missed: the property address "88 Rosewood" (no "St/Ave" suffix), the time "Thursday at 10" (no AM/PM), the CPL request hidden in "we still dont have" (no apostrophe), and the buyer name "Kowalski" sitting in the subject line with no label next to it.

Result

The real AI caught **all four** — plus the loan number, the office, a payoff follow-up task, and a proposed closing — verified on a freshly reset database and confirmed on a repeat run. During testing it once wrote the time as "10:00 AM" (the email never says AM); the extraction instructions were tightened to forbid invented AM/PM markers, and repeat runs came back clean.

Verification and safety

All 72 automated tests pass after the change — including inside a sandbox with no network access, which proves the test suite never calls the paid AI service. Type checks, lint, and the production build are all clean. The API key lives only in a local settings file that is never committed or shared; testing cost roughly ten cents total, and each future email costs about a penny to analyze.

What's next

Task A3: the human-judgment accuracy test — 20–30 real (redacted) office emails pasted into the app's Email Test Lab and scored on facts, requests, and filing. The bar is 15 of 20 fully correct before any work starts on connecting the live Outlook mailbox. The Outlook connector code exists but has never touched a real mailbox, and the app is a working prototype — not yet production infrastructure.

Before — the word-matching engine

Amber banner. Only three facts found; no address, no buyer, no CPL request, no time. Because it never found the address, it filed the email under “Property not yet identified.”

We sent it

This matters: the AI only looks for task requests in incoming mail, and only looks for task completions in mail you sent.

Analyze this email

Clear

Read by the basic word-matcher (rule-based-sim-v1)

This is the simple fallback engine, not a real AI. It only spots literal word patterns, so expect it to miss ordinary variation. Set AI_PROVIDER=Lm to switch on the real one.

WHAT THE AI UNDERSTOOD

Loan number

LN-44821

96%

Closing location

Cherry Hill office

85%

Closing date

Thursday

55%

This email was missing some closing details, so the AI also searched other messages to fill the gaps.

WHAT IT WANTS TO DO ABOUT IT

Create a task

88%

"Borrower is asking about Thursday at 10, does that still work for the Cherry Hill office?"

Type: Scheduling response Priority: normal Due: 8/1/2026 (guessed)

Why: Explicit request language: "Borrower is asking about Thursday at 10, does that still work for the Cherry Hill office?"

Create a task

88%

"Also can you confirm the payoff was ordered?"

Type: Payoff follow-up Priority: normal Due: 8/1/2026 (guessed)

Why: Explicit request language: "Also can you confirm the payoff was ordered?"

Schedule a closing

70%

Location: Cherry Hill office

Why: Closing details reconstructed from 1 source message(s); date/time/location require confirmation

WHICH FILE IT FILED THIS UNDER

Property not yet identified

POTENTIAL

Started a new transaction — it found no confident match

[Open the full record →](#)

SCORE IT

Ask yourself three things and keep a tally on paper:

1. Did it pull out the right facts, or invent/miss any?

2. Did it correctly spot whether someone was asking for something?

3. Did it file it under the right property?

Run 20-30 emails and count how many it got fully right. Below roughly 15 out of 20, switch to the real AI provider before building anything further.
